

Complete brand identity system for an AI-powered equity trading platform

The recommended brand package pairs the name **Arcis** (Latin for “fortress”) with a teal-on-dark color system, Inter + JetBrains Mono typography, and a five-triangle geometric logomark — creating an identity that bridges a GitHub repository today to a registered investment adviser in five years. This system draws on the visual language of Two Sigma (tech-institutional hybrid), the restraint of D.E. Shaw (precision-engineered minimalism), and the modern defense-tech energy of Anduril — occupying the uncontested intersection of defense-grade intelligence rigor and autonomous AI trading. Every element is designed to pass both a Bloomberg terminal glance-test and an SEC examiner’s scrutiny.

Naming: Arcis leads a field of 25 candidates

After analyzing naming patterns across the 400 largest hedge funds, a clear principle emerges: **one-word names correlate with higher median AUM**, acronyms correlate with lower AUM, and uniqueness matters more than category signaling. Limina Top quant funds cluster into mathematical references (Two Sigma, Squarepoint), fortress metaphors (Citadel), and founder eponyms (D.E. Shaw) — all short, phonetically crisp, and impossible to mistake for crypto.

The top five candidates, ranked:

1. Arcis — Latin genitive of *arx* (fortress, citadel, stronghold). The backronym works as a bonus: Adaptive Regime Classification & Intelligence Systems. Two syllables, zero crypto confusion, passes the “Arcis Capital Management” test flawlessly. When an LP asks what it means, the answer maps directly to the platform’s value proposition. Domain path: arciscapital.com likely available.

2. Corvus — Latin for raven; corvids are among the most intelligent animals, and Odin’s ravens Huginn (thought) and Muninn (memory) gathered intelligence daily. Also a real constellation. “Corvus Capital” sounds like an established London fund. The defense background adds resonance — ravens symbolize battlefield awareness.

3. Eigen — From eigenvalue/eigenvector, foundational to all quantitative finance (PCA, covariance matrices, factor models). German for “own/intrinsic.” Serves as a perfect

filter: LPs who recognize the term are exactly the LPs who'll appreciate the methodology. The mathematical purist's choice.

4. Inflect — From “inflection point,” the exact mathematical concept behind regime detection. When you say “we built Inflect to detect market inflection points,” the name *becomes* the strategy. Action-verb names (like Jump Trading) correlate with memorability. Most strategically aligned with the Traffic Light system.

5. Vantis — Coined from “vantage” with a Latin *-is* suffix. Sounds like it already manages \$5B. The safest, most institutionally smooth option — zero negative associations, zero crypto confusion, zero trademark conflicts. The trade-off is less distinctiveness than Arcis or Eigen.

Across all 25 candidates evaluated (5 classical/mythological, 5 scientific/mathematical, 5 nature-based, 5 coined, 5 acronym-based), names were assessed against SEC Rule 35d-1 constraints, phonetic quality, crypto-confusion risk, and the “X Capital” boardroom test. Key regulatory note: keep the parent brand abstract to avoid triggering the 80% investment policy basket requirement — add “Equity” or “Quantitative” only to specific fund product names. [SEC.gov](#)

Names to avoid and why

“Halcyon” itself carries soft, nostalgic connotations that don’t signal systematic intelligence. It appears in several existing fund names. Names prefixed with Bit-, Block-, Chain-, or suffixed with -fi, -X, or -swap trigger crypto associations. Nexos was eliminated due to proximity to Nexo (a crypto lending platform). Peregrine was flagged because Peregrine Financial Group collapsed in a 2012 fraud scandal — finance professionals remember.

Visual identity lessons from the industry’s best

Research across 15 firms reveals a clear institutional spectrum. At one extreme, Renaissance Technologies has essentially *no* public brand — the mystique is the brand, [Wikipedia](#) powered by **66% average annual returns**. [Finnotes](#) [Wikipedia](#) At the other, AQR publishes prolifically, with Cliff Asness’s combative intellectual voice driving brand awareness. [Wikipedia](#) The sweet spot for a new AI-powered fund sits at Two Sigma’s position: tech-institutional hybrid.

The pattern that creates institutional credibility is restraint over expression: fewer colors, simpler logos, less animation. Wordmark-only logos dominate top-tier quant firms [Metabrand](#) (Citadel, D.E. Shaw, Palantir, Anduril). The more elite the firm, the less

illustrative the logo. **Serif typefaces signal legacy authority** [Creative Bloq](#) (Citadel, Bridgewater); geometric sans-serifs signal modern precision [Noboringdesign](#) (Two Sigma, AQR, Palantir); and Helvetica specifically signals “respect tradition while building modern” (Anduril). [Fonts In Use](#)

Color patterns split cleanly by positioning. Traditional institutional firms use navy/white/black (Citadel, AQR). Tech-institutional hybrids use black with teal or cyan accents (Two Sigma). Defense tech uses black/white with neon green sparingly (Anduril, Palantir). The current teal accent (#0D9488) sits in proven territory — Two Sigma’s signature accent is a vibrant teal in the #00BFB3 range.

D.E. Shaw’s identity deserves special attention. Their wordmark, designed by Signal Type Foundry, encodes a **binary switch symbol** — the basic building block of a computer chip — into the letterforms. [Signal Type Foundry](#) [signalfoundry](#) This hidden reference to computational DNA is the gold standard for meaningful logo design: it rewards close observation without being literal. Three logo weights (light, medium, bold) demonstrate design sophistication across contexts. [Signal Type Foundry](#)

[signalfoundry](#)

The critical strategic insight: **the intersection of defense intelligence rigor and autonomous AI trading is unoccupied in brand space**. No current firm owns this positioning. The brand should communicate the precision expected from defense-grade systems, applied to equity markets.

Color system: three palettes unified by teal

Color psychology research confirms what the industry demonstrates: **blue decreases heart rate and creates calm** [Phoenixstrategy](#) (explaining why ~33% of top global brands use it), teal blends blue’s trust with green’s growth associations, and gold communicates premium exclusivity. Bloomberg’s iconic amber-on-black became so definitive that competitors adopted dark backgrounds to signal professional credibility.

[Bloomberg](#)

The current teal (#0D9488, Tailwind teal-600) is a strategically excellent choice. It sits at the intersection of institutional credibility and tech-forward innovation, differentiating from the navy blue that dominates traditional finance. All three palettes below share this teal and identical semantic colors (success, warning, danger), enabling brand continuity across contexts.

Palette A — “Institutional Authority”

For investor presentations, LP decks, and regulatory communications. Navy primary with teal accent.

Role	Light Mode	Dark Mode
Primary	#1B2A4A (Deep Navy)	#1B2A4A
Secondary	#3D5A80 (Steel Blue)	#3D5A80
Accent	#0D9488 (Teal)	#0D9488
Premium Accent	#B8860B (Dark Gold)	#B8860B
Background	#F8FAFC	#0F172A
Surface/Card	#FFFFFF	#1E293B
Text Primary	#0F172A	#F1F5F9
Text Secondary	#475569	#CBD5E1
Text Muted	#64748B	#94A3B8
Success	#059669	#059669
Warning	#D97706	#D97706
Danger	#DC2626	#DC2626

Palette B — “Technical Sophistication”

For the trading dashboard at halcyonlab.app. Teal-primary, dark mode default, optimized for extended monitoring.

Role	Light Mode	Dark Mode
Primary	#0D9488 (Teal)	#14B8A6 (Teal Light)
Secondary	#1E1B4B (Deep Indigo)	#312E81
Accent	#06B6D4 (Cyan)	#06B6D4
Background	#F0FDFA	#0B1120
Surface/Card	#FFFFFF	#141B2D

Text Primary	#134E4A	#ECFDF5
Text Secondary	#475569	#CBD5E1
Success	#059669	#10B981
Warning	#D97706	#F59E0B
Danger	#DC2626	#EF4444

Dark mode chart colors (8, colorblind-safe): #14B8A6 (Teal), #3B82F6 (Blue), #F59E0B (Amber), #A78BFA (Violet), #FB7185 (Rose), #22D3EE (Cyan), #FBBF24 (Yellow), #E879F9 (Fuchsia).

Palette C — “Research-Driven Innovation”

For white papers, blog posts, thought leadership. Sapphire blue + teal + amber — the all-rounder.

Role	Light Mode	Dark Mode
Primary	#1E40AF (Sapphire)	#3B82F6
Secondary	#0D9488 (Teal)	#14B8A6
Accent	#D97706 (Amber)	#F59E0B
Background	#F8FAFC	#111827
Surface/Card	FFFFFF	#1F2937
Text Primary	#111827	#F9FAFB

All palettes pass **WCAG AA contrast requirements**: text primary on backgrounds exceeds 15:1 (AAA), secondary text exceeds 7:1 (AAA), and muted text maintains 5:1+ (AA). [Accessibility Checker](#) Semantic colors use brighter variants in dark mode to maintain contrast on dark surfaces. [Phoenixstrategy](#)

Colorblind accessibility protocol

Never rely on color alone. All P&L indicators must include ▲/▼ arrows alongside green/red. Traffic Light regime states must include text labels (“RISK-ON,” “CAUTION,” “RISK-OFF”). Implement an optional CVD-safe toggle that replaces green with blue for positive values, following Bloomberg’s proven approach — their research found ~20,000

terminal users have some form of color vision deficiency.

Typography: Inter leads, with JetBrains Mono for financial data

Bloomberg Terminal uses a custom font designed by **Matthew Carter** [Quora](#) (creator of Georgia and Verdana), [Bloomberg](#) including fraction glyphs down to 1/64th granularity. [Quora +2](#) Citadel uses serif for its wordmark. Goldman Sachs and JPMorgan use serifs to signal heritage. Anduril chose Helvetica Now — “a metaphor for respecting the old while building modern.” [Fonts In Use](#) The pattern: serifs signal legacy, [Creative Bloq](#) geometric sans-serif signals precision, [Noboringdesign](#) and monospace signals engineering culture.

The critical technical requirement for financial dashboards is **tabular (fixed-width) figures**. When prices, P&L, and position sizes align in columns, every digit must occupy identical width. [MyFonts](#) The CSS:

```
.financial-data {
  font-variant-numeric: tabular-nums lining-nums;
  font-feature-settings: "tnum" 1, "lnum" 1;
}
```

Recommended font system: “Technical Clarity” with presentation upgrades

Role	Font	Weight	Size
Display/Headings	Inter (or Instrument Sans for presentations)	Bold 700, ExtraBold 800	H1: 36-44px, H2: 24-28px
Body Text	Inter	Regular 400, Medium 500	16px body, 14px small
UI/Dashboard	Inter	Regular 400, Medium 500, SemiBold 600	13-14px UI, 11-12px labels
Data/Monospace	JetBrains Mono	Regular 400, Medium 500	13px data, 14px code

Inter is unmatched for data-dense financial dashboards: tabular figures by default, variable font (100-900 weight in a single ~100KB WOFF2 file), 30+ OpenType features, and exceptional readability at 11px+. Designed by Rasmus Andersson at Figma specifically for screen interfaces.

JetBrains Mono provides crisp monospace with 138 coding ligatures and excellent character disambiguation (0/O, 1/l/I are all distinct) [JetBrains](#) — critical when misreading a digit can mean thousands of dollars. For investor-facing contexts where monospace might look too “developer,” substitute **Source Code Pro**, which resembles a sans-serif more than a typical code font. [Prototyp](#)

For investor presentations and marketing materials, add **Instrument Sans** at display sizes — a refined neo-grotesque [GitHub](#) that elevates above Inter’s SaaS ubiquity. For SEC filings, fall back to system serifs (Georgia/Times New Roman), which are standard and expected by regulators.

Dashboard visual hierarchy:

- H1 (page title): Inter ExtraBold, 24px, -0.03em tracking
- H2 (section): Inter SemiBold, 18px, -0.02em tracking
- Body: Inter Regular, 14px, line-height 20px
- UI Label: Inter Medium, 11px, 0.04em tracking, uppercase
- KPI number: Inter Bold, 28px, tabular-nums
- Financial data cell: JetBrains Mono Regular, 13px, tabular-nums, slashed-zero
- Ticker symbol: JetBrains Mono Medium, 12px, uppercase

Five logo concepts from abstract to evolved

Research reveals that abstract logos dominate elite quant firms and scale far better than literal imagery. The current AI branding landscape is saturated with swirling hexagons and gradient orbs (OpenAI, Google Gemini) — standing out means not following the AI logo playbook. [Ebaqdesign](#) The kingfisher mythology is a superb *verbal* brand story, but a literal bird illustration would code as consumer/retail. The recommendation: abstract the essence rather than depict the form.

Concept 1: “Prismatic Convergence” — Five equilateral triangles in a tight pentagonal formation, converging at a shared central point with 72° rotational symmetry. Each triangle represents one of the five AI agents. At 16×16 favicon, it reads

as a distinctive geometric rosette. Color: midnight navy #1A1F36 with subtle teal gradient #0A9396 . This is the strongest concept — it encodes the core product mechanic (five-agent consensus) into a geometric form that's instantly recognizable at any scale.

Concept 2: "The H-Mark" — A monogram where the crossbar sits at the golden ratio (61.8% from bottom), with vertical strokes tapered 3° inward to suggest a kingfisher's dive angle. The golden-ratio positioning is the hidden intelligence. Works brilliantly as a favicon. Risk: lettermarks can feel generic without masterful custom type design.

Concept 3: "Halcyon Signal" — An angular chevron (two lines meeting at ~35°, the kingfisher's dive angle) with a focal-point dot at the apex, paired with a wordmark. Teal symbol + navy wordmark creates a two-tone system. The chevron extracts perfectly at 16px. Must be carefully designed to avoid looking like a generic arrow.

Concept 4: "Quorum Grid" — A 3×3 matrix of nine nodes, five filled ("active") and four outlined, representing the 5-agent council's majority vote. Active nodes in graduated teal/amber/navy echo the Traffic Light system. Highly distinctive and conversation-starting, but risks looking "too techy" for traditional finance audiences.

Concept 5: "Emergence Helix" — A single continuous line tracing a logarithmic spiral following the golden ratio ($\phi \approx 1.618$), tilted at 35° off vertical. Three complete revolutions, line weight increasing from center to edge. Gradient from deep navy (concentrated analysis) to teal (execution). Beautiful as a scientific illustration, but spirals are trending in AI branding and risk feeling generic.

Strongest recommendation: Concept 1 (Prismatic Convergence) for its direct encoding of the five-agent architecture, excellent scalability, and geometric precision that signals quantitative rigor. Pair with a clean wordmark in Inter SemiBold or a custom geometric sans-serif.

Brand architecture scales from solo fund to multi-strategy

Citadel's branded house model — Wellington, Tactical Trading, Global Equities, all under one parent — is the industry template. Bridgewater takes a more evocative approach: Pure Alpha, All Weather, and Defensive Alpha are memorable names that describe investment philosophy rather than just strategy type. [Wikipedia](#) Two Sigma uses [Parent] + [Evocative Word] (Compass, Spectrum). [Wikipedia +2](#) Blackstone deliberately killed the GSO Capital sub-brand to consolidate under the parent, reasoning that "linking the Blackstone brand meant instant credibility with LPs we had never met."

Recommended three-phase architecture

Phase 1 (now – year 2): Monolithic. One name, one logo, one identity. The platform is “Arcis” (or chosen name). The single fund is “Arcis Fund” or “Arcis Autonomous Equity Fund.” All energy goes into building the parent brand.

Phase 2 (years 2–4): Branded house with evocative strategy names. Follow the [Arcis] + [Evocative Word] pattern: “Arcis Equinox” (long/short equity — equinox = equilibrium), “Arcis Meridian” (macro — meridian = global navigation), “Arcis Vertex” (quantitative alpha — vertex = mathematical peak). These evocative names avoid triggering SEC Rule 35d-1’s 80% requirement because they don’t describe a specific investment type — a genuine strategic advantage.

Phase 3 (years 4–5+): Full branded house. Parent entity: Arcis Capital Management. Flagship fund: just “Arcis” (the flagship earns the unadorned name). Technology/research arm: Arcis Labs. Possible execution arm: Arcis Securities, following Citadel/Citadel Securities’ model.

Brand voice sits at “research journal that ships code”

The recommended position on the tone spectrum is **65% academic paper, 35% tech startup** — more accessible than AQR’s white papers, more rigorous than a typical fintech pitch. The brand archetype is **70% Sage (wisdom, research depth) / 30% Creator (architectural innovation)**, evolving toward Sage-Ruler as AUM grows past \$10M+.

SEC AI-washing is a live enforcement priority

The SEC charged Delphia (\$225K penalty) and Global Predictions (\$175K penalty) in March 2024 specifically for misrepresenting AI capabilities. Delphia claimed AI could “predict which companies are about to make it big” when it hadn’t built the algorithm. Global Predictions called itself “the first regulated AI financial advisor” without substantiation. The SEC’s 2025-2026 examination priorities explicitly include scraping registrants’ public statements about AI use.

The cardinal rule: “Do what you say, say what you do.” Since Halcyon Lab genuinely uses Qwen3 8B LLMs with a 5-agent architecture, the key is describing what the system actually does — which is legally defensible and compelling on its own merits.

Critical word choices

	✗ Dangerous language
"AI-informed" or "AI-assisted"	"AI-powered" or "AI-driven" (vague, common in enforcement)
"Designed to pursue" or "seeks to identify"	"Will deliver" or "predicts"
"Systematic"	"Guaranteed" or "proven" (without audited track record)
"Research-driven"	"Proprietary black-box AI"
"Validation phase"	"Track record" (premature at current stage)
"Simulated results"	"Performance" or "returns" (for paper trading data)
"Fine-tuned language models"	"Custom-built AI" (misleading about provenance)

Recommended taglines (ranked by safety x impact)

1. **"Systematic equity research, built on large language models."** — Clean, factual, defensible. Describes exactly what it does.
2. **"Five perspectives. One disciplined process."** — References the 5-agent council without jargon. Intriguing, SEC-safe.
3. **"Structured reasoning for unstructured markets."** — Conceptually resonant. Captures LLM analysis of messy market dynamics.
4. **"Multi-agent AI architecture for systematic equity trading."** — Technically accurate for sophisticated audiences.
5. **"Research at machine scale. Risk management at human speed."** — Captures the human-in-the-loop philosophy.

Elevator pitch (30 seconds)

"I'm building [Arcis] — a systematic equity trading platform that uses a council of five specialized AI agents, each built on fine-tuned large language models, to analyze S&P 100 stocks from different perspectives: fundamental, technical, sentiment, macro, and risk. Think of it as replacing a single analyst's opinion with a structured debate among specialists. The system includes regime detection that adjusts positioning based on market conditions, and all trades execute through Alpaca with

built-in bracket orders for risk control. We're currently in our validation phase with live capital, building a track record before pursuing fund formation at three million in assets under management."

Technical description (quant/ML audience)

"[Arcis] implements a multi-agent large language model architecture for systematic equity analysis of S&P 100 constituents. The system deploys five specialized LLM agents — fine-tuned Qwen3 8B models covering fundamental analysis, technical pattern recognition, sentiment synthesis, macroeconomic regime assessment, and portfolio risk management — whose independent assessments are aggregated through a structured consensus mechanism. A proprietary regime detection layer ('Traffic Light') classifies the prevailing market environment across a green/yellow/red spectrum and modulates position sizing, sector exposure, and hedging parameters accordingly. Execution routes through Alpaca's API using bracket orders with pre-defined stop-loss and take-profit levels. Each agent's reasoning chain is logged and auditable, enabling post-trade attribution across analytical dimensions."

Dashboard design language: dark mode, card-plus-table hybrid

Bloomberg Terminal's effectiveness comes from **data density as a feature**: 30,000+ functions accessible to 320,000+ subscribers who build muscle memory around consistent patterns. [Bloomberg](#) The lesson isn't to copy Bloomberg's aesthetics but its principles: consistency, keyboard-first navigation, semantic color, and incremental evolution.

Dark mode as default

Professional trading platforms overwhelmingly use dark mode. Bloomberg's dark background "became the hallmark of being a financial superpower." [Bloomberg](#) Research confirms dark mode is better for extended monitoring, data-dense interfaces, and making chart colors pop. [Codequay](#) Use dark gray backgrounds (#0B0D12 to #1A1D26), never pure black — pure black causes halation and eye strain. [Toptal](#) Off-white text (#E8E9ED) rather than pure white for body text.

Layout system

--	--

Specification	Value
Grid	12-column, 16px gutters
Max container	1440px centered, fluid below
Spacing base	4px unit (4, 8, 12, 16, 24, 32, 48)
Card padding	16px compact (trader), 24px comfortable (investor)
Border radius	4px badges, 6px buttons, 8px cards, 12px modals
Row height (tables)	40px compact, 48px comfortable
Elevation (dark mode)	Background shifts + 1px borders, not shadows

Color coding for financial data

State	Hex	Icon	Label
Positive/Profit	#22C55E	▲	Always show +\$amount (+%)
Negative/Loss	#EF4444	▼	Always show -\$amount (-%)
Neutral/Flat	#9CA0AE	—	\$0.00 (0.00%)
Regime: Risk-On	#22C55E	●	“RISK-ON”
Regime: Caution	#F59E0B	●	“CAUTION”
Regime: Risk-Off	#EF4444	●	“RISK-OFF”

CVD-safe alternatives: Blue (#3B82F6) replaces green for positive, red stays unchanged — following Bloomberg’s proven approach. Bloomberg

Recommended tech stack

```
React 18+ / TypeScript / Next.js 14+ (App Router)
├─ Styling: Tailwind CSS v4 with CSS custom properties
├─ Components: shadcn/ui (Radix UI + Tailwind)
├─ Data Tables: TanStack Table (virtual scrolling for 10K+ rows)
├─ Charts (general): Recharts via shadcn/ui
├─ Charts (financial): TradingView Lightweight Charts (~45KB)
├─ Animation: Framer Motion (minimal — respect prefers-reduced-motion)
├─ Real-time: WebSocket native, batch updates every 100-200ms
```

Key component patterns

P&L Summary Bar (top of dashboard, full-width): Daily P&L | Weekly P&L | Cumulative P&L | Portfolio Value. Large number (28px Inter Bold, tabular-nums), small label above (11px, muted), delta arrow + percentage below.

Position Card (280px min width, ~140px height): Ticker (bold, 16px) + company name (muted, 13px) + P&L with % + share count + avg cost + 80×32px sparkline + portfolio weight. 3px left border colored by P&L direction.

AI Agent Council Panel: Five sub-cards showing each agent's vote (BUY/HOLD/SELL) with confidence percentage, converging to a consensus bar at 78% showing the aggregate. Color-coded by conviction level.

Trade Blotter: Table with timestamp, ticker, side (blue pill = buy, orange pill = sell), quantity, price, total, status (green/amber/gray/red dots), and originating agent.

The unified brand package recommendation

Bringing all seven research streams together into one coherent system:

Name: Arcis (primary recommendation) — "Arcis Capital Management, LLC" for the registered entity, "Arcis Labs" for the research/technology arm.

Color: Palette B (Technical Sophistication) for the dashboard, Palette A (Institutional Authority) for investor materials. Teal #0D9488 as the unifying accent across all contexts. Dark mode default for the product; light mode available.

Typography: Inter (variable, all weights) for headings, body, and UI. JetBrains Mono for financial data, tickers, and code. Instrument Sans for premium presentation display text. All available as Google Fonts, total payload under 200KB.

Logo: Concept 1 (Prismatic Convergence) — five triangles in pentagonal formation, encoding the five-agent architecture. Deep navy #1A1F36 primary with teal #0D9488 accent. Three-tier system: full mark (symbol + wordmark), icon-only (favicon, app icon), wordmark-only (formal documents).

Voice: Sage-Creator archetype, 65/35 academic-to-startup ratio. Lead with architecture description, not outcome promises. Use "AI-informed" and "systematic" as core modifiers. Maintain SEC-compliant language from day one — build the substantiation file now for every public claim.

Architecture: Monolithic brand through fund formation. Evocative sub-names ([Arcis] + [single word]) when expanding to multiple strategies. Reserve the unadorned "Arcis" for the flagship fund.

Dashboard: Dark mode default, shadcn/ui component library, DesignRevision 12-column grid with 4px spacing base, Inter + JetBrains Mono typography, green/red semantic colors with mandatory arrow/text redundancy for accessibility.

This system is designed to evolve. The teal accent, geometric logo, and precise typography work equally on a GitHub README today and a Bloomberg terminal listing in five years. The voice guidelines ensure every public statement builds toward SEC registration rather than creating compliance debt. The architecture plan provides a clear naming roadmap from single strategy to multi-strategy fund family. Every hex code, font weight, and spacing value is specified — ready to implement in Tailwind CSS and ship.
